#### Describe the present and original (if known) physical appearance

The Conroe bridge crosses Clark's Creek approximately 5 miles east-northeast of Junction City on a county road. It is a single span "rainbow arch" (or "Marsh arch") measuring 100 feet in length. Its 20 foot wide roadway has been resurfaced periodically but this has not significantly compromised the bridge's integrity. Marsh's plans called for whatever filling material, between the bridge deck curbs, that locality might desire.

The bridge's abutments rest approximately 30 feet below grade and the low water level lies approximately 25 feet below grade.

The best description of a rainbow arch span is contained in James Marsh's 1911 patent application. The bridge consists of ". . . two abutments (which could be piers), a pair of arches disposed between and springing from the abutments, the floor carried by and between the arches and reaching from one abutment to the other where it alines with the parapets or rails along opposite sides of the floor line." The original patents called for slideable wear plates to be moulded into the concrete where the bridge floor came into contact with the beams and abutments. This is of importance as one of the main benefits of this design was to allow for the expansion and contraction of the reinforced concrete bridge under varying conditions of temperature and moisture.

There were two basic rainbow arch designs, fixed and tied. The original patent application describes the fixed type such as the Conroe bridge in which case the arch flowed below the bridge deck and was "fixed" directly into the abutment. This massive abutment (or pier) resisted both the horizontal and the vertical thrust of the arch. In a tied design the arch did not flow below the deck line and was not fixed directly into the abutment. It was secured atop the abutment or pier by the use of steel rocker or expansion rocker bearings. Vertical thrust was resisted by the pier and bearing, while horizontal thrust was resisted by the addition of a lower chord.

#### Statement of Significance (in one paragraph)

The Conroe "rainbow arch" (or "Marsh arch") bridge east-northeast of Junction City, Kansas retains its integrity of location, design, setting, materials, feeling, and association. It is associated with the life of James B. Marsh, pioneer in steel and concrete bridge construction. The bridge embodies the distinctive characteristics of a type and method of construction that is no longer used, and, as such, may yield information important to the history of engineering. Although 72 rainbow arch bridges are currently known to exist in Kansas the ever-changing needs of modern transportation have made them an endangered species.

James Barney Marsh was born in 1856 at North Lake, Wisconsin. He went to Iowa at the age of 18 to enter preparatory school at Fredericksburg. Marsh graduated in 1882 from Iowa State College of Agriculture and Mechanical Arts in Ames, with a B.M.E. degree. In March of 1883 he began his professional career in the Des Moines office of the King Bridge Company of Cleveland, Ohio. With King, Marsh was involved in the design, sales and actual erection of metal bridges. While he continued to work with the King Company, he also became head of the Northern Agency for the Kansas City Bridge and Iron Company. In this capacity, he both designed and superintended the actual construction work done by the company. By March of 1889, Marsh had become general western agent and contracting engineer for the King Bridge Company and was placed in charge of the general western office in Des Moines. In the spring of 1896, he formed his own company, the Marsh Bridge Company, and was its sole proprietor. In private practice as a contracting engineer, Marsh was able to more fully develop his own designs. He also constructed the designs he developed, usually using steel as a medium. At the turn of the century, Marsh initiated the use of both concrete and steel in his bridge design. In April of 1904, the Marsh Bridge Company was incorporated with Marsh as president and chief engineer. In 1909, the company was reorganized as the Marsh Engineering Company.

It was not until the introduction of the "rainbow arch" by Marsh, that Kansas made widespread use of reinforced concrete spans for major stream crossings. Marsh canvassed the midwest, selling his arches in direct competition with the steel trusses at that time.

The contract for the construction of the Conroe bridge was let to Fred Luttjohann of Topeka on December 16, 1924 for a bid of \$17,291.60. Luttjohann was also awarded the contract for another rainbow arch over Lyons creek and work began on this structure almost immediately.

By August 13, 1925 the Lyons creek bridge had been completed and Luttjohann had begun excavation work on the Conroe bridge.

The Junction City Weekly Union reported on December 10, 1925 that only a little concrete work remained to be done on the structure. Work was to proceed during the cold weather by using hot sand and hot water to mix the concrete. The slab could then be kept warm by lighted lanterns covered with tarpaulins.

The Weekly Union reported the bridge's completion on December 24, 1925.
